

Creating Procedures

Objectives

1. **Identify the benefits of modularized and layered subprogram design**
2. **Create and call procedures**
3. **Use formal and actual parameters**
4. **Use positional, named, or mixed notation for passing parameters**
5. **Identify the available parameter-passing modes**
6. **Handle exceptions in procedures**
7. **Remove a procedure**
8. **Display the procedures' information**

Subprogram Design

Procedures

Exception Handling

Using a modularized and layered subprogram design and identifying the benefits of subprograms

- Creating and calling procedures
- Identifying the available parameter-passing modes
- Using formal and actual parameters
- Using positional, named, or mixed notation

Handling exceptions in procedures, removing a procedure, and displaying the procedures' information

Creating a Modularized Subprogram Design

Modularize code into subprograms.

- Locate code sequences repeated more than once.
- Create subprogram P containing the repeated code
- Modify original code to invoke the new subprogram.

Creating a Layered Subprogram Design

Create subprogram layers for your application.

- Data access subprogram layer with SQL logic
- Business logic subprogram layer, which may or may not use the data access layer

Modularizing Development with PL/SQL Blocks

- PL/SQL is a block-structured language. The PL/SQL code block helps modularize code by using:
 - Anonymous blocks
 - Procedures and functions
 - Packages
 - Database triggers
- The benefits of using modular program constructs are:
 - Easy maintenance
 - Improved data security and integrity
 - Improved performance
 - Improved code clarity

What Are PL/SQL Subprograms?

- A PL/SQL subprogram is a named PL/SQL block that can be called with a set of parameters.
- You can declare and define a subprogram within either a PL/SQL block or another subprogram.
- A subprogram consists of a specification and a body.
- A subprogram can be a procedure or a function.
- Typically, you use a procedure to perform an action and a function to compute and return a value.
- Subprograms can be grouped into PL/SQL packages.

The Benefits of Using PL/SQL Subprograms

Easy maintenance

Improved code clarity

**Subprograms:
Stored procedures
and functions**

**Improved data
security and integrity**

Improved performance

Differences Between Anonymous Blocks and Subprograms

Anonymous Blocks	Subprograms
Unnamed PL/SQL blocks	Named PL/SQL blocks
Compiled every time	Compiled only once
Not stored in the database	Stored in the database
Cannot be invoked by other applications	Named and, therefore, can be invoked by other applications
Do not return values	Subprograms called functions must return values.
Cannot take parameters	Can take parameters

Subprogram Design

Procedures

Exception Handling

Using a modularized and layered subprogram design and identifying the benefits of subprograms

- Creating and calling procedures
- Identifying the available parameter-passing modes
- Using formal and actual parameters
- Using positional, named, or mixed notation

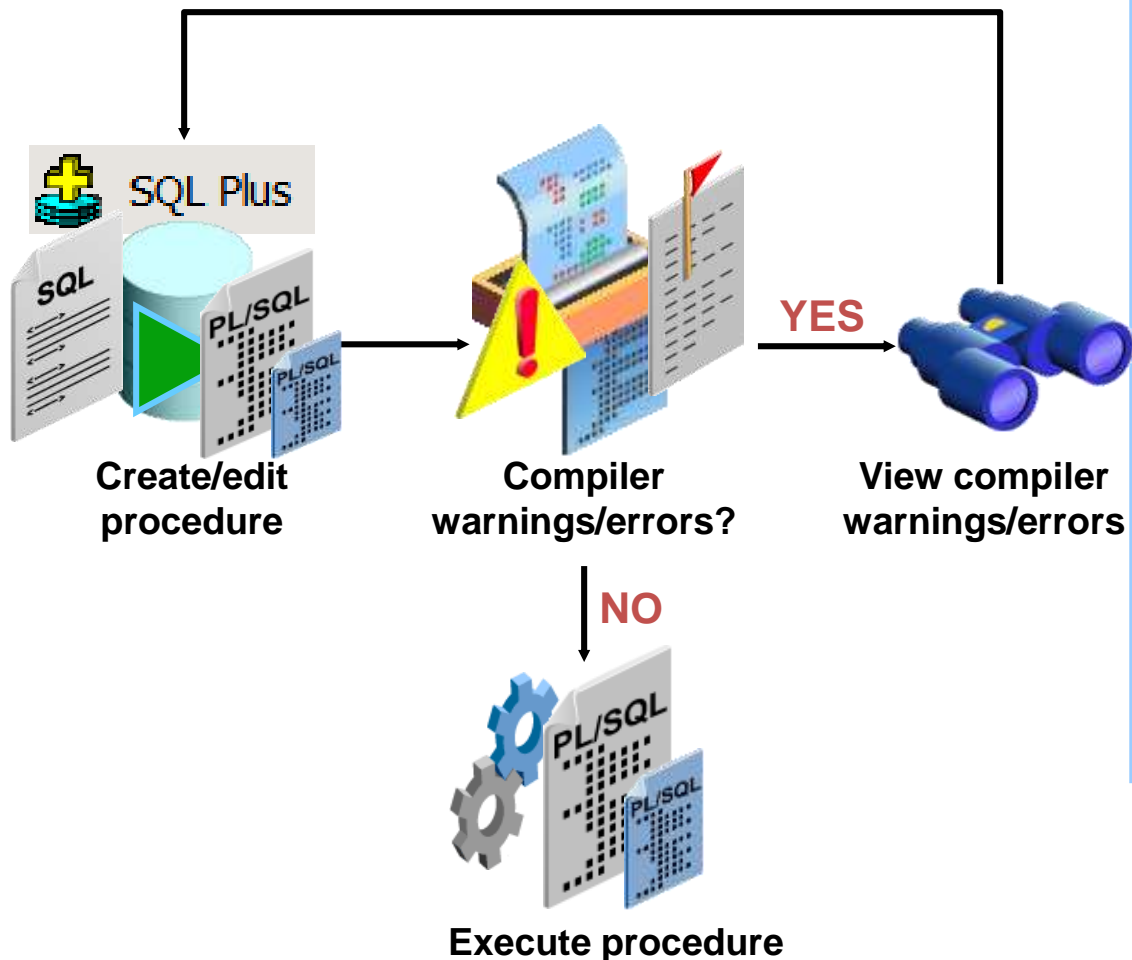

Handling exceptions in procedures, removing a procedure, and displaying the procedures' information

What Are Procedures?

- Are a type of subprogram that perform an action
- Can be stored in the database as a schema object
- Promote reusability and maintainability

Creating Procedures: Overview

View errors/warnings in SQL Developer

Use SHOW ERRORS command in SQL*Plus

Use USER/ALL/DBA_ERRORS views

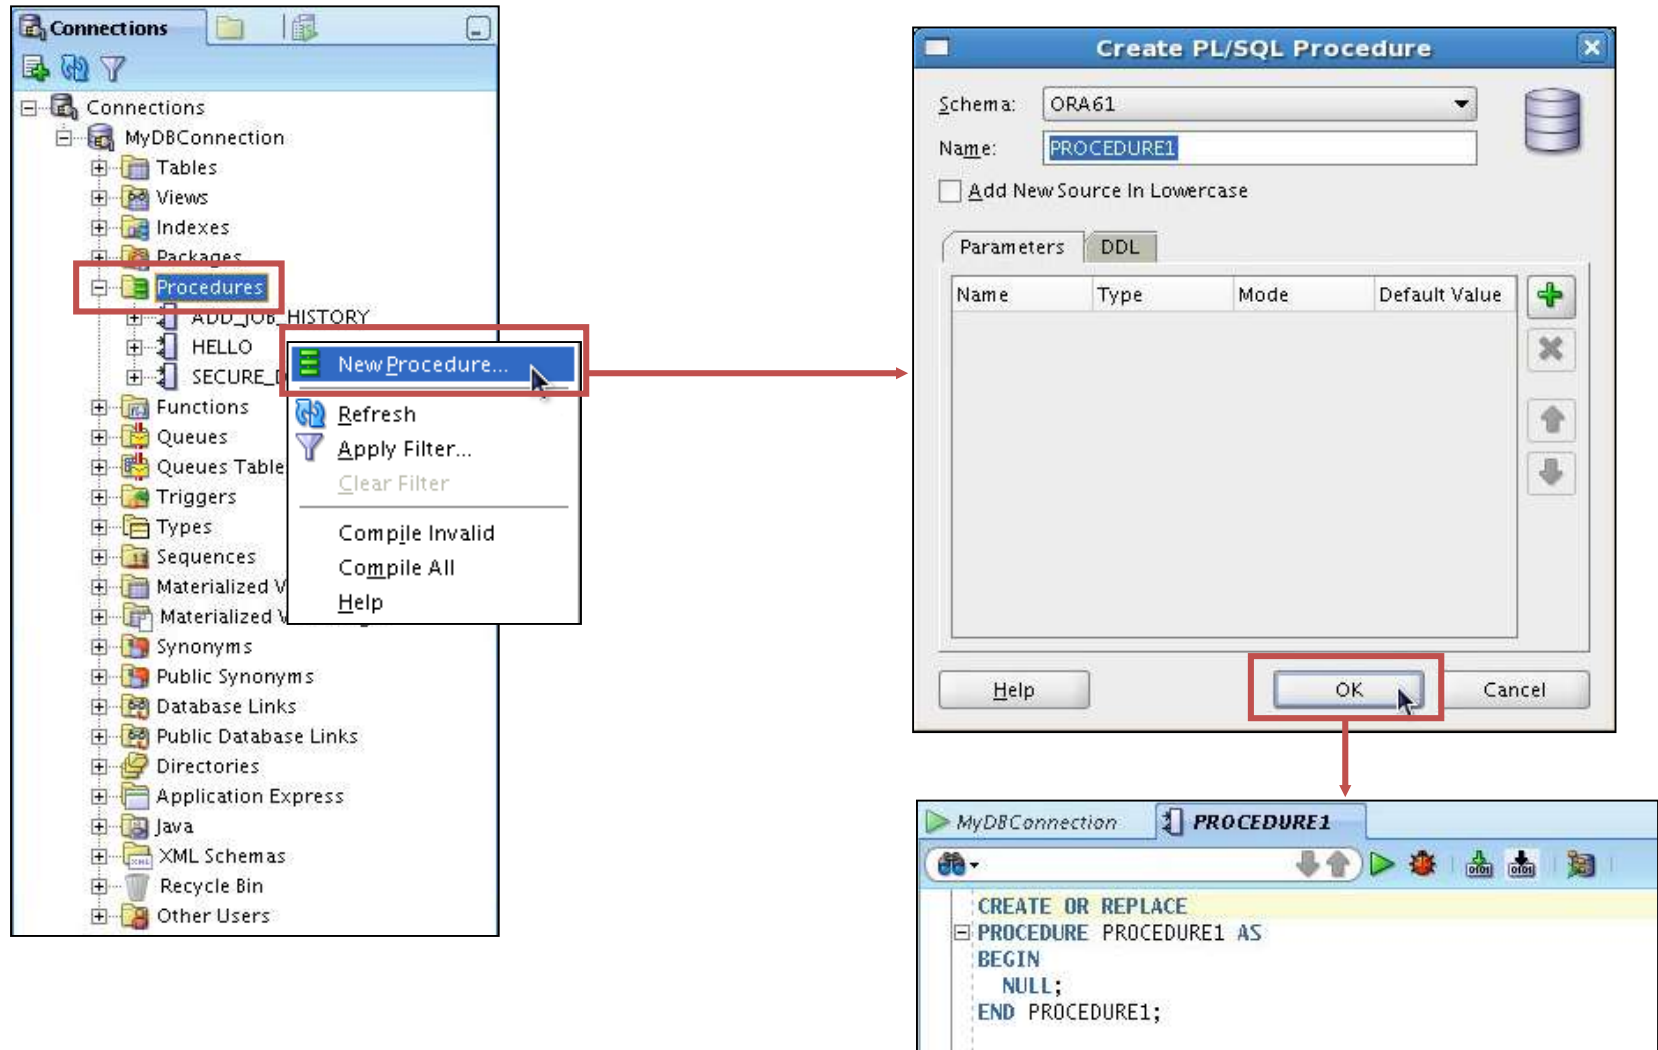

Creating Procedures with the SQL CREATE OR REPLACE Statement

- Use the `CREATE` clause to create a stand-alone procedure that is stored in the Oracle database.
- Use the `OR REPLACE` option to overwrite an existing procedure.

```
CREATE [OR REPLACE] PROCEDURE procedure_name
  [(parameter1 [mode] datatype1,
    parameter2 [mode] datatype2, ...)]
IS|AS
  [local_variable_declarations; ...]
BEGIN
  -- actions;
END [procedure_name];
```

PL/SQL block

Creating Procedures Using SQL Developer

Compiling Procedures and Displaying Compilation Errors in SQL Developer

1

OR

2

Compiler - Log

Project: /home/oracle/.sqldeveloper/system1.5.4.59.41/o.sqldeveloper.11.1.1.59.41/DefaultWorkspace/Project1.jpr

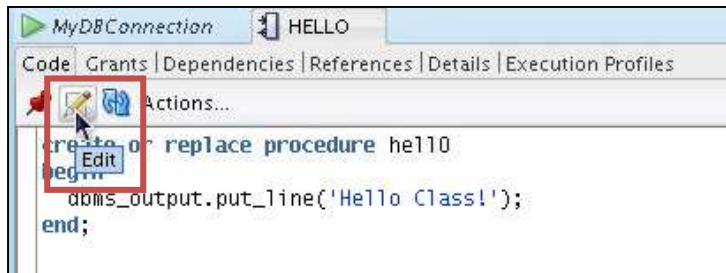

PROCEDURE ORA61.HELLO@MyDBConnection

Error(3,1): PLS-00103: Encountered the symbol "BEGIN" when expecting one of the following: (; is with authid as cluster co

Messages Compiler

```
create or replace procedure hello
begin
  dbms_output.put_line('Hello Class!');
end;
```

Correcting Compilation Errors in SQL Developer

1. Edit procedure

2. Correct error (add keyword IS)

4. Recompile successful

3. Recompile procedure

Naming Conventions of PL/SQL Structures Used in This Course

PL/SQL Structure	Convention	Example
Variable	v <i>_variable_name</i>	v_rate
Constant	c <i>_constant_name</i>	c_rate
Subprogram parameter	p <i>_parameter_name</i>	p_id
Bind (host) variable	b <i>_bind_name</i>	b_salary
Cursor	cur <i>cursor_name</i>	cur_emp
Record	rec <i>record_name</i>	rec_emp
Type	type <i>_name_type</i>	ename_table_type
Exception	e <i>_exception_name</i>	e_products_invalid
File handle	f <i>_file_handle_name</i>	f_file

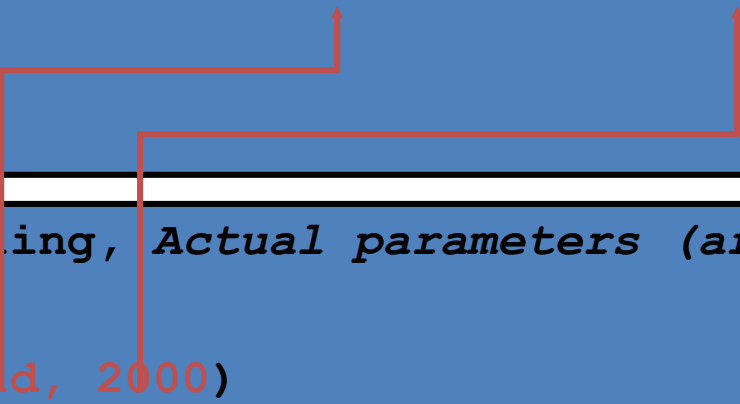

What Are Parameters and Parameter Modes?

- Are declared after the subprogram name in the PL/SQL header
- Pass or communicate data between the calling environment and the subprogram
- Are used like local variables but are dependent on their parameter-passing mode:
 - An `IN` parameter mode (the default) provides values for a subprogram to process
 - An `OUT` parameter mode returns a value to the caller
 - An `IN OUT` parameter mode supplies an input value, which may be returned (output) as a modified value

Formal and Actual Parameters

- Formal parameters: Local variables declared in the parameter list of a subprogram specification
- Actual parameters (or arguments): Literal values, variables, and expressions used in the parameter list of the calling subprogram

```
-- Procedure definition, Formal parameters  
CREATE PROCEDURE raise_sal(p_id NUMBER, p_sal NUMBER) IS  
BEGIN  
  . . .  
END raise_sal;
```

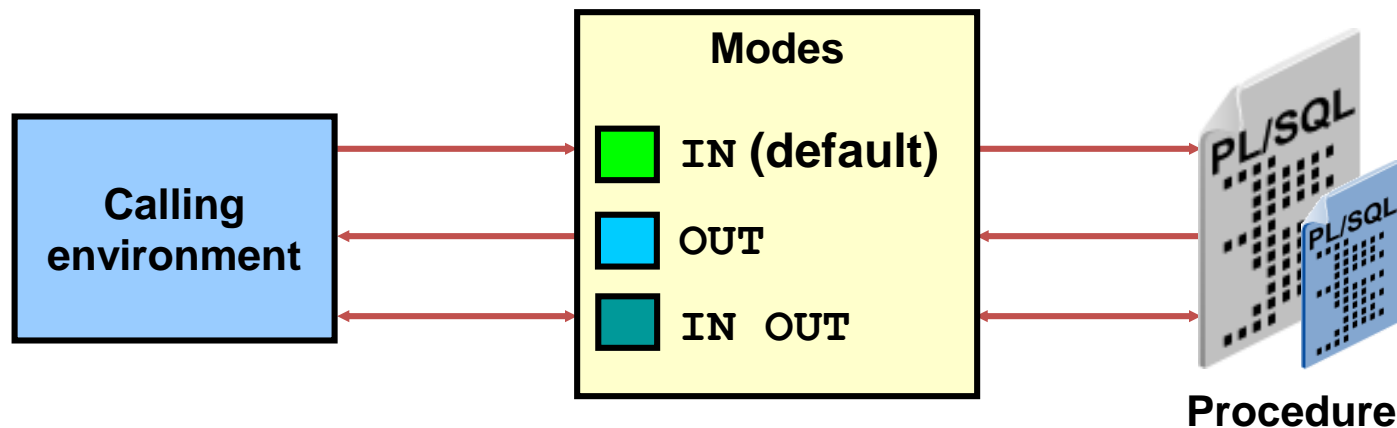

```
-- Procedure calling, Actual parameters (arguments)  
v_emp_id := 100;  
raise_sal(v_emp_id, 2000)
```

Procedural Parameter Modes

- Parameter modes are specified in the formal parameter declaration, after the parameter name and before its data type.
- The `IN` mode is the default if no mode is specified.

```
CREATE PROCEDURE proc_name (param_name [mode] datatype)  
...
```

Comparing the Parameter Modes

IN	OUT	IN OUT
Default mode	Must be specified	Must be specified
Value is passed into subprogram	Value is returned to the calling environment	Value passed into sub-program; value returned to calling environment
Formal parameter acts as a constant	Uninitialized variable	Initialized variable
Actual parameter can be a literal, expression, constant, or initialized variable	Must be a variable	Must be a variable
Can be assigned a default value	Cannot be assigned a default value	Cannot be assigned a default value

Using the IN Parameter Mode: Example

```
CREATE OR REPLACE PROCEDURE raise_salary
(p_id      IN employees.employee_id%TYPE,
 p_percent IN NUMBER)
IS
BEGIN
    UPDATE employees
    SET     salary = salary * (1 + p_percent/100)
    WHERE  employee_id = p_id;
END raise_salary;
/
```

```
EXECUTE raise_salary(176, 10)
```

Using the OUT Parameter Mode: Example

```
CREATE OR REPLACE PROCEDURE query_emp
(p_id      IN  employees.employee_id%TYPE,
p_name     OUT employees.last_name%TYPE,
p_salary  OUT employees.salary%TYPE) IS
BEGIN
    SELECT  last_name, salary INTO p_name, p_salary
    FROM    employees
    WHERE   employee_id = p_id;
END query_emp;
/
```

```
SET SERVEROUTPUT ON
DECLARE
    v_emp_name employees.last_name%TYPE;
    v_emp_sal  employees.salary%TYPE;
BEGIN
    query_emp(171, v_emp_name, v_emp_sal);
    DBMS_OUTPUT.PUT_LINE(v_emp_name||' earns '||
        to_char(v_emp_sal, '$999,999.00'));
END;
/
```

Using the IN OUT Parameter Mode: Example

Calling environment

```
CREATE OR REPLACE PROCEDURE format_phone
  (p_phone_no IN OUT VARCHAR2) IS
BEGIN
  p_phone_no := '(' || SUBSTR(p_phone_no,1,3) ||
                ')' || SUBSTR(p_phone_no,4,3) ||
                '-' || SUBSTR(p_phone_no,7);
END format_phone;
/
```

```
anonymous block completed
b_phone_no
-----
8006330575

anonymous block completed
b_phone_no
-----
(800) 633-0575
```

Viewing the OUT Parameters:

Using the DBMS_OUTPUT.PUT_LINE Subroutine

Use PL/SQL variables that are printed with calls to the DBMS_OUTPUT.PUT_LINE procedure.

```
SET SERVEROUTPUT ON

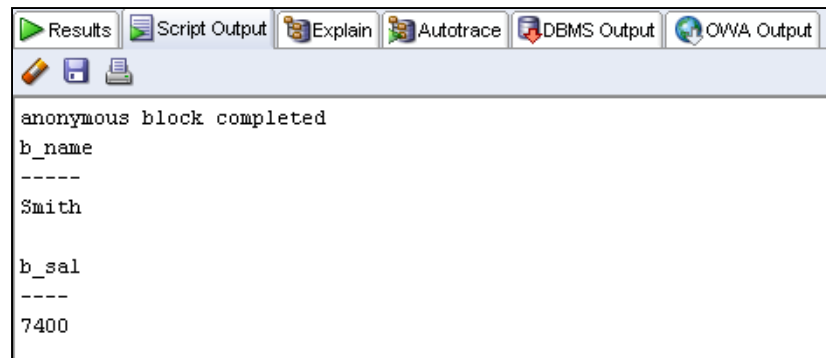

DECLARE
  v_emp_name employees.last_name%TYPE;
  v_emp_sal   employees.salary%TYPE;
BEGIN
  query_emp(171, v_emp_name, v_emp_sal);
  DBMS_OUTPUT.PUT_LINE('Name: ' || v_emp_name);
  DBMS_OUTPUT.PUT_LINE('Salary: ' || v_emp_sal);
END;
```

```
anonymous block completed
Name: Smith
Salary: 7400
```

Viewing OUT Parameters: Using SQL*Plus Host Variables

1. Use SQL*Plus host variables.
2. Execute QUERY_EMP using host variables.
3. Print the host variables.

```
VARIABLE b_name    VARCHAR2(25)
VARIABLE b_sal      NUMBER
EXECUTE query_emp(171, :b_name, :b_sal)
PRINT b_name b_sal
```

The screenshot shows the SQL*Plus interface with the following tabs: Results, Script Output, Explain, Autotrace, DBMS Output, and OWA Output. The main window displays the output of the SQL*Plus session:

```
anonymous block completed
b_name
-----
Smith
b_sal
-----
7400
```

Available Notations for Passing Actual Parameters

- When calling a subprogram, you can write the actual parameters using the following notations:
 - Positional: Lists the actual parameters in the same order as the formal parameters
 - Named: Lists the actual parameters in arbitrary order and uses the association operator ($=>$) to associate a named formal parameter with its actual parameter
 - Mixed: Lists some of the actual parameters as positional and some as named
- Prior to Oracle Database 11g, only the positional notation is supported in calls from SQL
- Starting in Oracle Database 11g, named and mixed notation can be used for specifying arguments in calls to PL/SQL subroutines from SQL statements

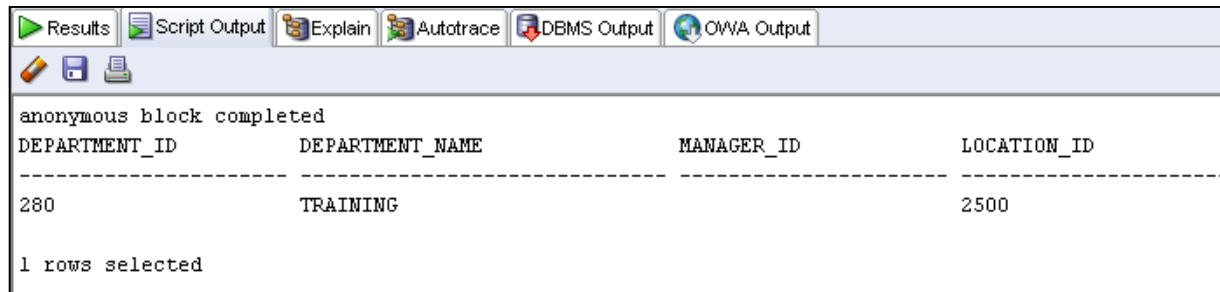

Passing Actual Parameters: Creating the add_dept Procedure

```
CREATE OR REPLACE PROCEDURE add_dept(  
  p_name IN departments.department_name%TYPE,  
  p_loc  IN departments.location_id%TYPE) IS  
BEGIN  
  INSERT INTO departments (department_id,  
                           department_name, location_id)  
  VALUES (departments_seq.NEXTVAL, p_name , p_loc );  
END add_dept;  
/
```

Passing Actual Parameters: Examples

```
-- Passing parameters using the positional notation.  
EXECUTE add_dept ('TRAINING', 2500)
```

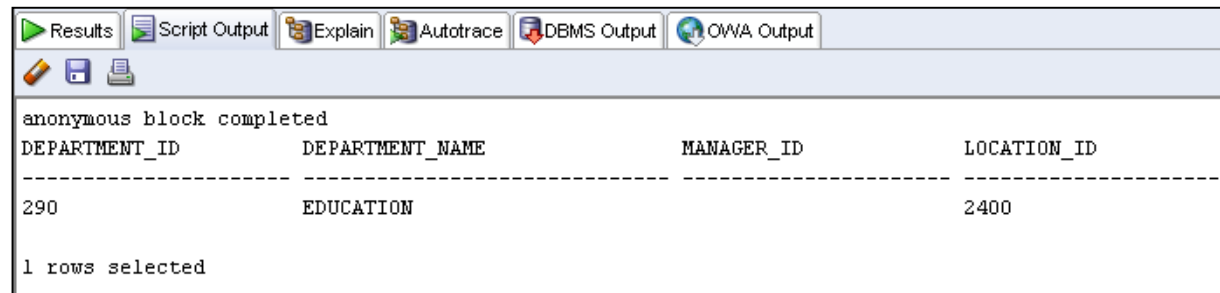

The screenshot shows the SQL Developer interface with the 'Results' tab selected. It displays the output of the 'add_dept' procedure. The message 'anonymous block completed' is shown above a table. The table has four columns: DEPARTMENT_ID, DEPARTMENT_NAME, MANAGER_ID, and LOCATION_ID. The data row shows DEPARTMENT_ID as 280, DEPARTMENT_NAME as TRAINING, MANAGER_ID as null, and LOCATION_ID as 2500. Below the table, it says '1 rows selected'.

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
280	TRAINING		2500

1 rows selected

```
-- Passing parameters using the named notation.  
EXECUTE add_dept (p_loc=>2400, p_name=>'EDUCATION')
```

The screenshot shows the SQL Developer interface with the 'Results' tab selected. It displays the output of the 'add_dept' procedure. The message 'anonymous block completed' is shown above a table. The table has four columns: DEPARTMENT_ID, DEPARTMENT_NAME, MANAGER_ID, and LOCATION_ID. The data row shows DEPARTMENT_ID as 290, DEPARTMENT_NAME as EDUCATION, MANAGER_ID as null, and LOCATION_ID as 2400. Below the table, it says '1 rows selected'.

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
290	EDUCATION		2400

1 rows selected

Using the DEFAULT Option for the Parameters

- Defines default values for parameters
- Provides flexibility by combining the positional and named parameter-passing syntax

```
CREATE OR REPLACE PROCEDURE add_dept(  
  p_name departments.department_name%TYPE := 'Unknown',  
  p_loc  departments.location_id%TYPE  DEFAULT 1700)  
IS  
BEGIN  
  INSERT INTO departments (department_id,  
    department_name, location_id)  
  VALUES (departments_seq.NEXTVAL, p_name, p_loc);  
END add_dept;
```

```
EXECUTE add_dept  
EXECUTE add_dept ('ADVERTISING', p_loc => 1200)  
EXECUTE add_dept (p_loc => 1200)
```

- You can call procedures using anonymous blocks, another procedure, or packages.
- You must own the procedure or have the `EXECUTE` privilege.

```
CREATE OR REPLACE PROCEDURE process_employees
IS
    CURSOR cur_emp_cursor IS
        SELECT employee_id
        FROM   employees;
BEGIN
    FOR emp_rec IN cur_emp_cursor
    LOOP
        raise_salary(emp_rec.employee_id, 10);
    END LOOP;
    COMMIT;
END process_employees;
/
```

```
PROCEDURE process_employees Compiled.
```

Calling Procedures Using SQL Developer

1 Select the procedure `RAISE_SALARY` from the **Procedures** list.

2 Right-click on the selected procedure and select **Run** (Ctrl-F11).

3 In the **Run PL/SQL** dialog, replace the default parameters with actual values:

```
1 DECLARE
2   P_ID NUMBER;
3   P_PERCENT NUMBER;
4 BEGIN
5   P_ID := NULL;
6   P_PERCENT := NULL;
7
8   RAISE_SALARY(
9     P_ID => P_ID,
10    P_PERCENT => P_PERCENT
11 );
12 END;
```

4 Click **OK** to execute the procedure.

Run PL/SQL dialog details:

Parameter	Data Type	Mode
P_ID	NUMBER	IN
P_PERCENT	NUMBER	IN

PL/SQL Block:

```
1 DECLARE
2   P_ID NUMBER;
3   P_PERCENT NUMBER;
4 BEGIN
5   P_ID := NULL;
6   P_PERCENT := NULL;
7
8   RAISE_SALARY(
9     P_ID => 176,
10    P_PERCENT => 10
11 );
12 END;
```

Subprogram Design

Procedures

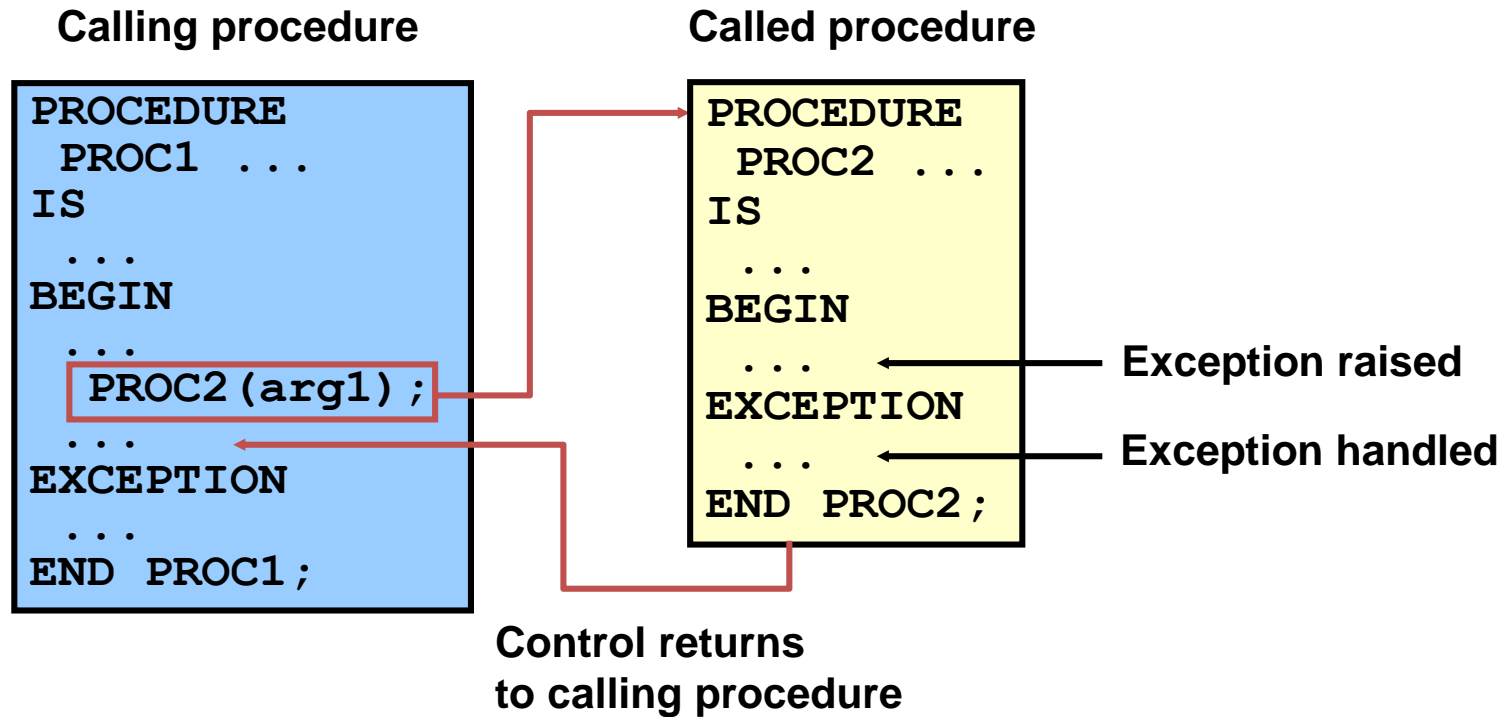

Exception Handling

Using a modularized and layered subprogram design and identifying the benefits of subprograms

- Creating and calling procedures
- Identifying the available parameter-passing modes
- Using formal and actual parameters
- Using positional, named, or mixed notation

Handling exceptions in procedures, removing a procedure, and displaying the procedures' information

Handled Exceptions

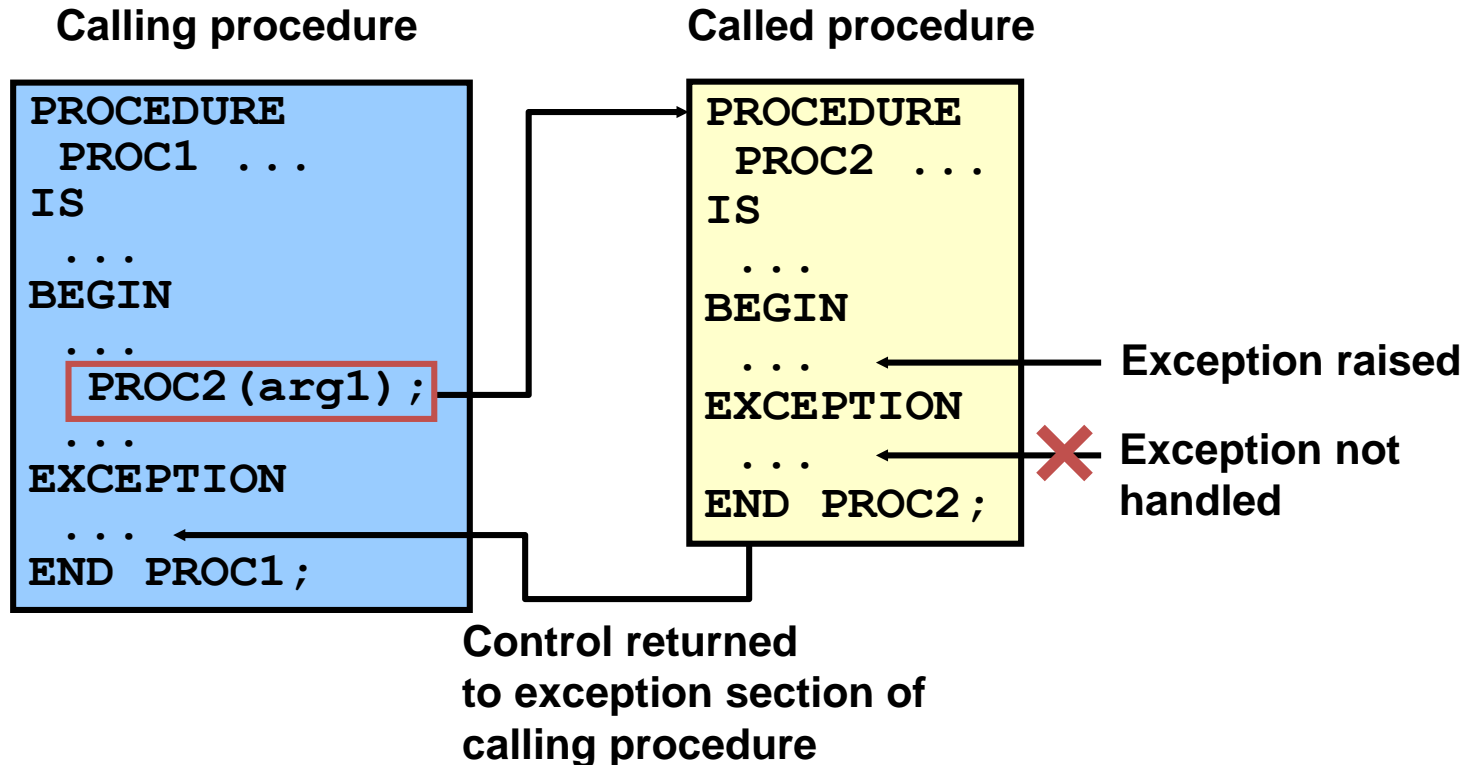

Handled Exceptions: Example

```
CREATE PROCEDURE add_department(  
    p_name VARCHAR2, p_mgr NUMBER, p_loc NUMBER) IS  
BEGIN  
    INSERT INTO DEPARTMENTS (department_id,  
        department_name, manager_id, location_id)  
    VALUES (DEPARTMENTS_SEQ.NEXTVAL, p_name, p_mgr, p_loc);  
    DBMS_OUTPUT.PUT_LINE('Added Dept: ' || p_name);  
EXCEPTION  
    WHEN OTHERS THEN  
        DBMS_OUTPUT.PUT_LINE('Err: adding dept: ' || p_name);  
END;
```

```
CREATE PROCEDURE create_departments IS  
BEGIN  
    add_department('Media', 100, 1800);  
    add_department('Editing', 99, 1800);  
    add_department('Advertising', 101, 1800);  
END;
```

Exceptions Not Handled

Exceptions Not Handled: Example

```
SET SERVEROUTPUT ON
CREATE PROCEDURE add_department_noex(
    p_name VARCHAR2, p_mgr NUMBER, p_loc NUMBER) IS
BEGIN
    INSERT INTO DEPARTMENTS (department_id,
        department_name, manager_id, location_id)
    VALUES (DEPARTMENTS_SEQ.NEXTVAL, p_name, p_mgr, p_loc);
    DBMS_OUTPUT.PUT_LINE('Added Dept: ' || p_name);
END;
```

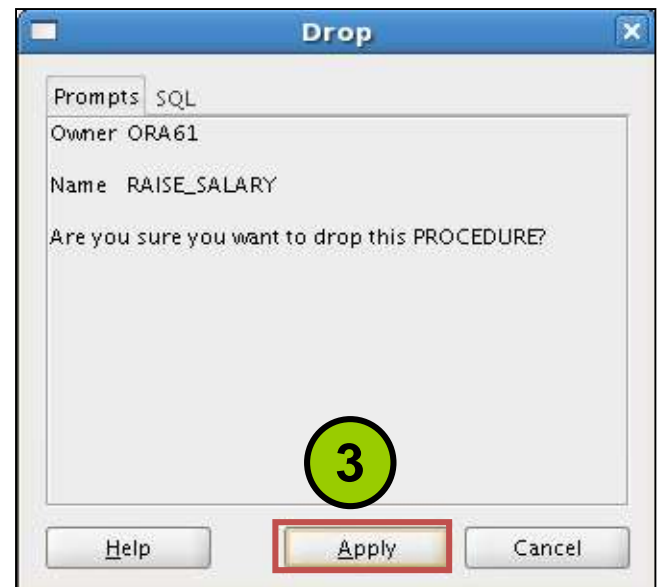

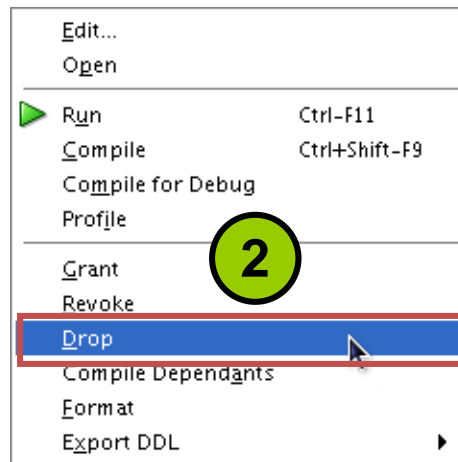

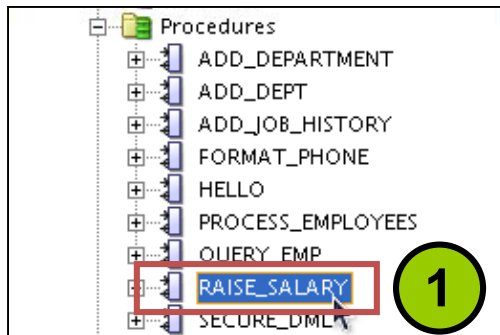

```
CREATE PROCEDURE create_departments_noex IS
BEGIN
    add_department_noex('Media', 100, 1800);
    add_department_noex('Editing', 99, 1800);
    add_department_noex('Advertising', 101, 1800);
END;
```

Removing Procedures: Using the DROP

- Using the DROP statement:

```
DROP PROCEDURE raise_salary;
```

- Using SQL Developer

Viewing Procedure Information Using the Data Dictionary Views

```
DESCRIBE user_source
```

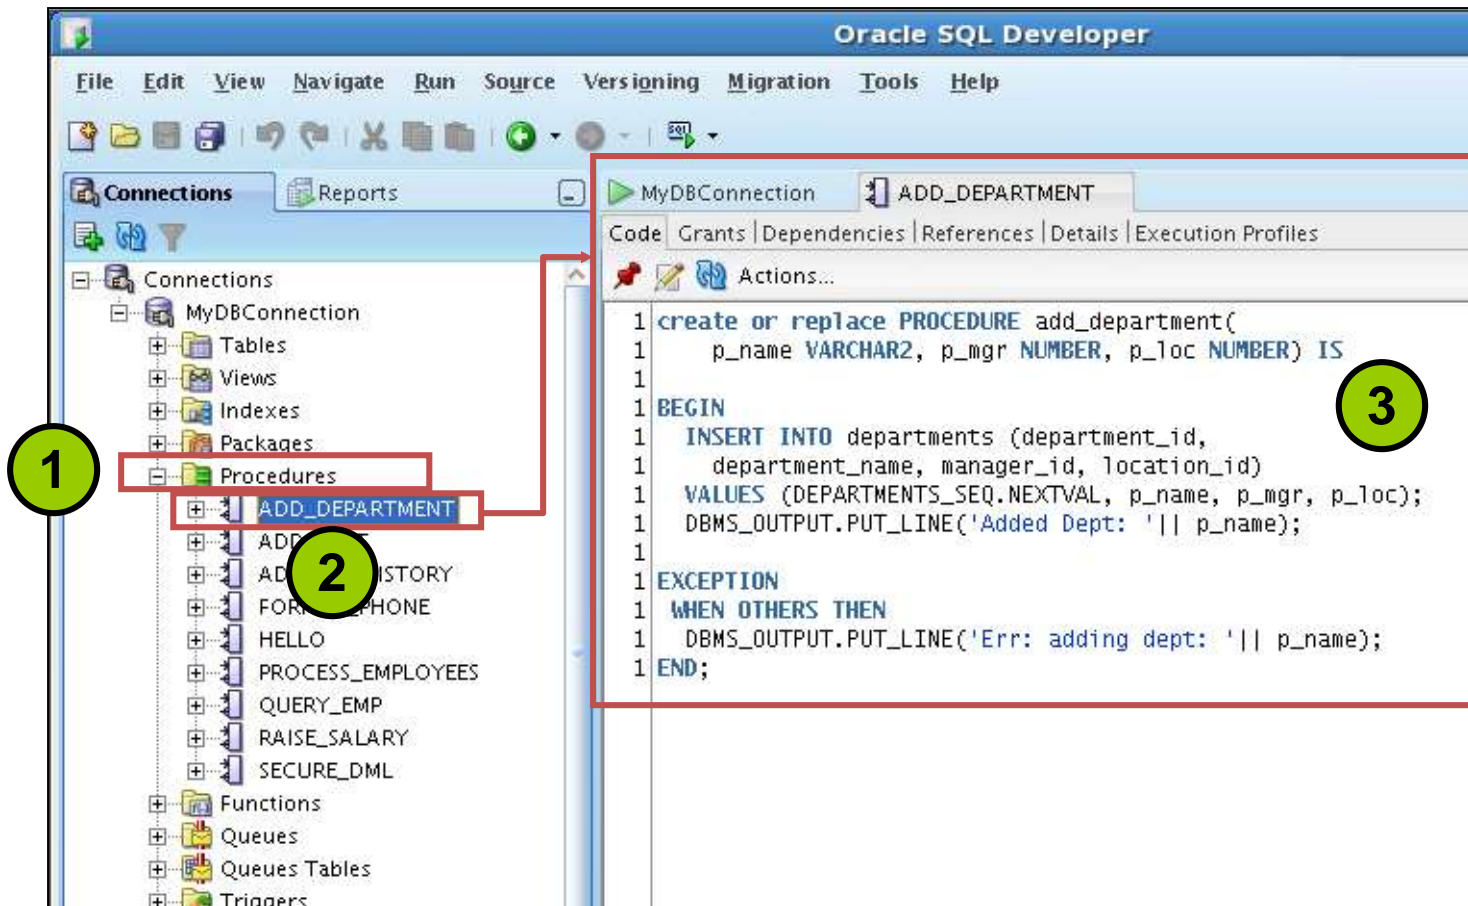

```
DESCRIBE user_source
Name          Null    Type
-----
NAME          VARCHAR2(30)
TYPE          VARCHAR2(12)
LINE          NUMBER
TEXT          VARCHAR2(4000)

4 rows selected
```

```
SELECT text
FROM   user_source
WHERE  name = 'ADD_DEPT' AND type = 'PROCEDURE'
ORDER BY line;
```

LINE	TEXT
1	PROCEDURE add_dept(
2	p_name IN departments.department_name%TYPE,
3	p_loc IN departments.location_id%TYPE) IS
4	
5	BEGIN
6	INSERT INTO departments(department_id, department_name, location_id)
7	VALUES (departments_seq.NEXTVAL, p_name, p_loc);
8	END add_dept;

Viewing Procedures Information Using the SQL Developer

Formal parameters are literal values, variables, and expressions used in the parameter list of the calling subprogram

1.True

2.False
